**Usual Covid-19 PPE:** A patient with no aerosol-generating procedures (AGPs)* anticipated:
- Any room (standard room non-AIIR)
- Droplet precautions (procedure mask)
- Contact precautions (gown, gloves)
- Eye protection (goggles or face shield)

*Notes:*
If an AGP is needed unexpectedly: close the door, don N95 respirator and consider moving the patient to an AIIR on a unit for the appropriate level of care. Following an AGP in a standard room, an N95 must be worn by all entering for 70 minutes post-procedure. Replace the droplet precautions sign with airborne precautions sign.

**N95 Covid-19 PPE:** A patient with aerosol-generating procedures anticipated: *(All ICU patients are in this category.)*
- Airborne Infection Isolation Room (AIIR)**
- or Negative Pressure unit
- Airborne precautions (N95 or PAPR always)
- Contact precautions (gown, gloves)
- Eye protection (goggles or face shield)

**All people entering the room must be in the appropriate PPE.**

*Aerosol-generating procedures (AGP):* can include cardiopulmonary resuscitation, all respiratory therapy procedures, airway management including placement, exchange and removal of an artificial airway, tracheostomy care, airway suctioning (open suctioning, not in-line suctioning); sputum induction, bronchoscopy and non-bronchoscopic bronchoalveolar lavage, autopsies, nebulizer treatments, CPAP, BiPAP, placement or removal of an NG tube. **NP (nasopharyngeal) or OP (oropharyngeal) swab is not currently considered an AGP**

**Airborne infection isolation (AIIR):** A room with airflow engineered to reduce the risk of airborne infection transmission.
